Project Management.

The integrated project management software

With its many industry-specific solutions, Abacus Project Management enables targeted, efficient profitability control for projects, employees and machines.

All relevant project information is available anytime, anywhere. That means a swift and timely response to changing circumstances. Services rendered can be invoiced at any stage of a project, which is important for efficient cash management.

Offer and project processes can be optimised so that you can reduce the administrative effort and thereby increase the profitability of your company. In addition, you have control over the pre and post-calculation of projects at all times.

For all company sizes and industries
Thanks to a high degree of flexibility in the definition of service types, entry and settlement options, appropriate solutions can be found for companies of all sizes and from all industries. Master data such as employees, addresses, material and assets are jointly maintained and utilised.

No interfaces
The Project Management is seamlessly integrated into the other Abacus modules, such as Financial Software, Stock Management, Production Planning, Order Processing, Assets Ledger, Human Resources, Address Management, and Service & Contract Management, and addition to the smartphone app AbaClik and the iPad time recording terminal AbaClock.
